

About: The OffsiteDataSync Private Vault provides enterprise markets a method of leveraging our cloud-based backup while managing it entirely within their organization. This offering is based on a private vault located on premise at either a single or multi-site enterprise location.

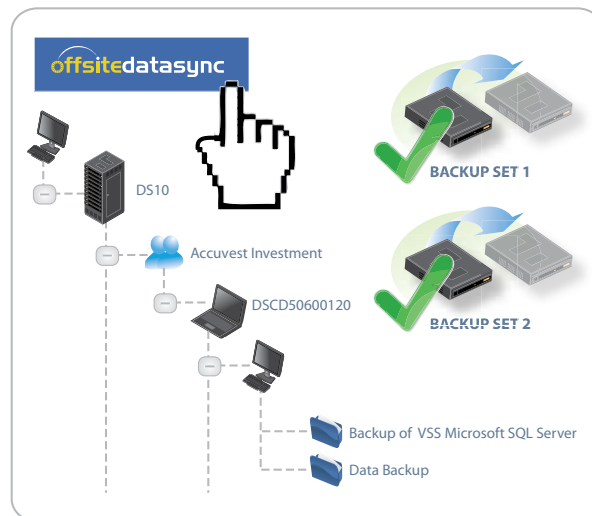

Single-Site Enterprise: For single-site enterprise deployments, both server and notebook backups are sent directly to an in-house vault. OffsiteDataSync vaults can then be leveraged as a replication end-point in a single location or multiple diverse geographic U.S. locations, providing offsite protection. A private data archiving vault and remote management web portal are optional add-ons

Multi-Site Enterprise: For Multi-site enterprise deployments, both server and notebook backups are sent directly to an in-house vault. A fully-featured replication vault can be setup in a second enterprise location and is designed to provide optional offsite protection. A private data archiving vault and remote management web portal are optional add-ons.

Archive Vault: The OffsiteDataSync Archive Vault is an add-on feature for weekly, monthly and annual data retention. Fully compliant with stringent government, medical and financial regulations, the OffsiteDataSync Archive Vault is designed to automate the traditionally cumbersome and difficult task of data archiving.

Web Portal: Leverage our Web Portal via private intranet to manage, monitor and even deploy your backup solution with the OffsiteDataSync Web Portal. Monitor the status of your vault, backup sets, and perform restorations from the convenience of your desktop, Smartphone or any other internet ready device.
